

# ShadowNet™

*Network congestion and service disruptions can really hurt your business. You need assurance that effective network continuity exists at all times. You need ShadowNet from NetWolves.*

ShadowNet adds unmatched performance, availability and protection to your existing network infrastructure. Standard with ShadowNet is ASURERoute, NetWolves' unique dynamic alternate routing technology that determines when your required service levels are not being met on your primary circuit. ASURERoute is able to determine, on an application-by-application basis, if performance problems exist, and route traffic to an available secondary circuit that provides uninterrupted service, again on an application-by-application basis. ASURERoute will continue to monitor network conditions, and when service levels can be met it will permit traffic to once again utilize the primary circuit.

ShadowNet is available with several circuit technologies to choose from as the secondary means of network connectivity. Whether it's DSL, cable modem, ISDN, frame relay or even satellite, NetWolves can provide the appropriate circuit to meet your demanding business requirements in nearly any location across the nation, and safeguard you from costly service disruptions.

ShadowNet also comes with NetWolves' formidable ICSA-certified firewall technology to keep your proprietary business applications protected from malicious predators. A comprehensive range of support services round out this powerful and cost-effective solution, all of which are available on one monthly invoice from a company you have come to know and trust for network security and performance – NetWolves.

## *ASURERoute*

ASURERoute can support any circuit technology serving as the primary and secondary means of network connectivity, including DSL, cable modem, satellite, frame relay, private line, ISDN, and IP. ASURERoute can also be monitored and configured remotely from a central location using NetWolves' patent-pending Secure Remote Monitoring and Management system.
